

Upgrade Business Critical PowerBuilder Applications for a Major Logistics Business

Client: Anonymous

Business Size: Corporation

Industry: Logistics

Country: Belgium

Technology: PowerBuilder

Objective: Upgrade six business-critical PowerBuilder applications.

The Brief

OCS Consulting was charged, by a major logistics company based in Belgium, with upgrading the six applications and ensuring that the applications would run on current operating systems utilising a supported SQL Server database.

More Detail

These legacy applications had been created by a third party and were no longer supported by any form of technical support.

The applications were running PowerBuilder V7 against an SQL Server 2008 database (in SQL compatibility mode) and executing in an MS Windows Server 2012 environment.

Results

- The OCS Consulting team migrated all the PowerBuilder applications to PB 2019R3
- All the database objects were updated
- Testing established the apps would continue to work with SQL Server 2019
- Over 450 stored procedures, triggers and views were modified

OCS Goes Further

The OCS team resolved all the migration issues and made sure all embedded SQL was QL 2019 compliant.

The team also ensured all SQL was able to execute using the MS OELDB database driver, thus making sure all the PowerBuilder-related stack was a supported version and deployable onto a Windows Server 2019.

In Addition

OCS also migrated several VB6, ASP and ASP .NET applications to run on Windows Server 2019, replacing obsolete Flash controls and ensuring the applications were usable on a range of current browsers.
